No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                              1 atgtacaacgggtcgtgctg......acattgttgagtggcactga 1041

                                                                                                                                                                                                          The present invention relates to the isolation of a novel human G-protein coupled receptor (GPCR) which is related to the chemokine receptor subfamily. The CDNA and gene sequences encoding for GPCR are also given in the invention. The sequences of the invention are useful for diagnosing and treating diseases or conditions mediated by human proteases. Such diseases include hyperpoliferative disorders (e.g. hyperplasia), neurological disorders (e.g. parkinson's disease), psychiatric diseases (e.g. schizophrenia), inflammatory disorders (e.g. adult respiratory disorders) and respiratory disorders (e.g. adult respiratory distress syndrome, ARDS). The GPCR protein is also useful for identifying distress syndrome, particularly modulating a biological for identifying a modulator of the expression of the protein. It also serves as a target for identifying agents for use in mammalian therapeutic applications, e.g. a human drug, particularly modulating a biological or pathological response in a cell or tissue that expresses the protein, in biological assays. GPCR is also useful in diagnosing a disease or predisposition to a disease mediated by the peptide, in pharmacogenomic analysis. The control of the novel human GPCR of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             hRUP19 The endogenous and non-endogenous, constitutively activated versions of human G-protein coupled receptors (GPCR), are useful for direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists having applicability as therapeutic agents for treating diseases related to GPCR, e.g. lung cancer. Non-endogenous version of human GPCRs are also utilized in research settings and in vitro and in vivo system, incorporating GPCRs can be utilised to elucidate and understand the roles these receptors

                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to novel G protein-coupled receptors

(nGPCRx; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27,

28, 31-38, 40, 41, 53-60) and their coding sequences. The present

sequence is the coding sequence for one such G protein-coupled receptor.

GPCRs are also known as seven transmembrane receptors and function in

signal transduction. The nGPCRx coding sequences are useful for

screening a human to diagnose a disorder affecting the brain or a genetic

c predisposition, specifically schizophrenia. nGPCRx are useful for

identifying compounds useful for treating schizophrenia. Detection of

c for disposition, specifically schizophrenia. nGPCRx are useful for

c disporders in a sample is useful as a diagnostic tool for diseases or

c disporders, infections such as HIV-1, metabolic and cardiovascular

c diseases, proliferative disorders, renal failure, rheumatoria arthritis,

c nGPCRx activity have the utility for treating neurological disorders,

c including schizophrenia, ADHD/ADD (attention deficit-hyperactivity

disorder/attention deficit disorder), and neuronal disorders such as

c diseases, proliferative disorders, migraine and semile dementia.

Additional disorders include inflammatory conditions (e.g. Crohn's

c respiratory aliments auch as asthma, and inflammatory diseases e.g.

The invention relates to nucleic acid sequences (ABAB1529-ABA81552) that encode G-coupled protein-receptor related polypeptides

(ABB44527-ABB44543). The isolated polypeptide having a sequence differing by no more than 15 % of amino acid residues from one of 22 amino acid capture forms of the sequences), fully defined in the sequences (or mature forms of the sequences), fully defined in the sequences (or mature forms of the sequences), fully defined in the sequences (or mature forms of the sequences), fully defined in the sequences (or mature forms of the sequences), fully defined in the sequences (or mature forms of the sequences), fully defined in the sequences (or mature forms of the sequences), fully defined in the sequences or sepecially defined in the collypeptides can be administered therapeutically, especially using gene polypeptides can be administered therapeutically, especially using gene captures, especially in humans. For example, they can be used to treat/prevent cardiomyopathy, atherosclerosis, disorders collosis, asthma, cancers, neurodegenerative disorders (e.g. Alzheimer's clasease, parkinson's disorder, Huntington's disease, multiple sclerosis, asthma, cancers, neurodegenerative disorders, immune disorders, hadmatopoietic disorders, developmental diseases, immune disorders, bacterial, fungal, protozoal and viral infections (e.g. with humans) by detecting alterations in polypeptide expression levels relative to control samples. They are useful to identify agents binding polypeptide control samples they are useful to identify agents binding polypeptide (e.g. callular receptors or deversament.)

control samples and agonists in disease areating activity, useful as modellating callular polypeptide expression or activity, useful as modellating callular polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New human G-protein coupled receptor X, GPCRX, polypeptide useful in treatment or prevention of GPCRX associated disorders e.g. cardiomyopathy or atherosclerosis, and to screen for antagonists and agonists useful therapeutically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SK;

The isolated polypeptide having a sequence differing by no more than 15 % of amino acid residues from one of 22 amino acid sequences (or mature forms of the sequences), fully defined in the sequences (or mature forms of the sequences), fully defined in the sequences) polypeptides. The polypeptides have potential cardiant, antiarteriosclerotic, anabolic, cytostatic and antiviral activity. The

CECRX associated disorders, especially in humans. For example, they can be used to treat/prevent cardiomyopathy, atheosoclerosis, disorders related to signal processing and metabolic pathway modulation (e.g. obesity, anorexia), diabetes, osteoporosis, Crohn's disease, multiple sclerosis, asthma, cancers, neurodegenerative disorders (e.g. Alzheimer's disease, Parkinson's disorders, developmental disease), immune disorders, neurodegenerative disorders (e.g. Alzheimer's bacterial, fungal, protozoal and viral infections (e.g. with human conferency virus (HIV)-1 or HIV-2). They can be used dispossitally to detecrine the presence of or predisposition to a disease associated with altered levels of the polypeptide expression levels relative to control samples. They are useful to redefice the public protozoal and disposition to a disease associated control samples. They are useful to redeficience of or predisposition to a disease associated (e.g. cellular receptors or downstream effectors) and/or agents modulating cellular polypeptide expression or activity, useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    480

collypeptides and polynucleotides. GCREC polypeptides are useful in screening compounds that modulate their activity. They are useful in the diagnosis, prevention and treatment of disorders which include cell proliferative disorders such as arteriosclerosis, hepatitis, myelofibrosis, psoriasis and cancer including adenocarcinoma, leukaemia, lymphoma; neurological disorders such as epilepsy, isohaemic locarebrowscular disease, Alzheimer's disease, Pick's disease, dementia, Parkinson's disease, ataxias, multiple sclerosis, bacterial and viral meningitis, Creutzfeldt-Jakob disease, schizophrenic disorders, annesia; cardiovascular disorders such as arteriovenous fistula, atherosclerosis, hypertension, vascular tumnors, myocardial infarction, hypertensive heart disease, infective endocarditis, cardiomyopathy, myocarditis; gastrointestinal disorders such as dysphagia peptic oesophagitis, emesis, anorexia, nausea, peptic ulcer, cholelithiasis, diarrhoea, constipation, acquired immune deficiency syndrome (AIDS), hepatic dermestitis, Crohn's disease, diabetes mellitus, Goodpasture's syndrome, disease, allergies, spondylitis, amyloidosis, anaemia, asthma, contact dermatitis, Crohn's disease, diabetes mellitus, Goodpasture's syndrome, cupysemm, Grave's disease, gout, multiple sclerosis, rheumaeich cupysemm, Grave's disease, gout, multiple sclerosis, rheumaeich cupysemm, Grave's disease, gout, multiple sclerosis, rheumaeich cupysamic disorders such as diabetes, obesity and osteoporosis; and viral infections such as diabetes, obesity and osteoporosis; and curral infections such as diabetes, obesity and osteoporosis; and curral infections such as diabetes, obesity and osteoporosis; and curral infections such as diabetes, obesity and osteoporosis; and curral infections such as diabetes, obesity and osteoporosis; and curral infections such as diabetes, obesity and osteoporosis; and curral infections arenavirus, bunyavirus. Polynoicedice of the hovention are compounded to the propertice of the propertice of the disorders such a
                                                                                                                        Novel G-protein coupled receptors and polynucleotides useful for diagnosis, treatment and prevention of disorders of cell proliferation, neurological, cardiovascular, metabolic disorders and viral infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      240

The invention describes a novel isolated polynucleotide (I) encoding a human HM74-like G-protein coupled receptor (GPCR) polypeptide. Reagents that regulate HM74-like GPCR are useful for modulating the activity of their regulate HM74-like GPCR are useful for modulating the activity of the regulate HM74-like GPCR are useful form modulating the activity of the protein in a disease selected from bacterial, fungal, protozoan, and viral infection, pain, cancer, anorexia, bulimia, asthma, central nervous consistence, asthma, inflammation, allergy, benign prostatic hypertension, papertension, angina pectoris, myocardial infarction, urinary retention, osteoporosis, ulcer, asthma, inflammation, allergy, benign prostatic hypertrophy, culcer, asthma, inflammation, allergy, benign prostatic hypertrophy, culcer, syndrome. The composition is also useful for treating consistence of multiple sclerosis and disorders such as anxiety, schizophrenia, manic depression, delirium, dementia and severe mental retardation. (I) or the HM74-like GPCR polypeptide are also useful for treating the above consists of alseases, susceptibility to diseases and abnormalities related to the consense of multiples in the nucleic acid sequences which may act as agonists or antagonists at the receptor site and which can be regulated to provide therapeutic effects. The polypeptide is also useful as a balt convide therapeutic effects. The polypeptide is also useful as a balt convide therapeutic effects. The polypeptide is also useful as a balt convidence who have a provide therapeutic effects. The polypeptide is also useful as a balt convidence of muchapeutic effects. The polypeptide is also useful as a balt convidence of provide therapeutic effects. The polypeptide is also useful as a manmal convidence of muchapeutic effects. The polypeptide is also useful as a balt convidence of muchapeutic effects. The polypeptide is also useful as a manmal convidence of muchapeutic effects. The polypeptide is also useful as a manmal convidence of muchapeutic effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel isolated polynucleotide, useful for treating infection, pain, cancer, asthma, hypertension, myocardial infarction, urinary retention, osteoporosis, encodes the human HM74-like G-protein coupled receptor polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120

The present invention relates to the isolation of a novel human G-protein coupled receptor (GPCR) which is related to the chemokine receptor subfamily. The CDNA and gene sequences encoding for GPCR are also given in the invention. The sequences of the invention are useful for diagnosing and treating diseases or conditions mediated by human protected seases. Such diseases include hyperproliferative disorders.

(e.g. hyperplasia), neurological disorders (e.g. Parkinson's disease), psychiatric diseases (e.g. schizophrenia), inflammatory disorders (e.g. diabetes) and respiratory disorders (e.g. alabetes) and respiratory disorders (e.g. alabetes) and respiratory disorders (e.g. diabetes) and respiratory disorders (e.g. alabetes) and respiratory disorders (e.g. diabetes) and respiratory disorders (e.g. alumen diag.) The GPCR protein is also useful for identifying a modulator of the expression of the protein. It also serves as a target for identifying agents for use in mammalian therapeutic applications, e.g. a mumund drug, particularly modulating a bological or pathological response in a cell or tissue that are related to members of the chemokine assays related to GPCRs that are related to members of the chemokine assays. GPCR is also useful in diagnosing a disease or predisposition to a disease mediated by the peptide, in pharmacogenomic analysis. The present

The invention relates to nucleic acid sequences (ABAB1529-ABAB1525) that encode G-coupled protein-receptor related polypeptides

CG (ABB44522-ABB44543). The isolated polypeptide having a sequence differing to more than 15% of amino acid residues from one of 22 amino acid sequences (or mature forms of the sequences), fully defined in the sequences (or mature forms of the sequences), fully defined in the completication and corresponding to human G-protein coupled receptor X (GPCRX) polypeptides. The polypeptides have potential cardiant, antiarteriosclerotic, anabolic, cytostatic and antiviral activity. The colypeptides can be administered therapeutically, especially using gene therapy and expressing the encoding DNA in vivo, to treat or prevent CG GPCRX-associated disorders, especially in humans. For example, they can compare the colopies of the colopy and expressing and metabolic pathway modulation (e.g. cobesity, anorexia), diabetes, osteoporosis, Crohn's disease, multiple colopies, parkinson's disorder, Huntington's disease, parkinson's disorder, Huntington's disease, parkinson's disorder, Huntington's disease, immune disorders, contermine the presence of or predisposition to a disease associated content and evels of the polypeptide expression levels of the polypeptide expression levels callular receptors or flowestive to determine the bresence of or predisposition to a disease associated control samples. They are useful to identify agents binding polypeptide control samples or the polypeptide expression levels callular polypeptide expression levels finding polypeptide control samples. They are useful to identify agents binding polypeptide control samples or predisposition or activity, type, they are useful to describe a control samples. They are useful to a describe and a control samples or the polypeptide controls and the presence of the polypeptide controls and the presence of the polypeptide controls and the polypeptide appression levels and a dispersed and a control as the polypeptide controls and the pol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CTGCTCATTGTGGCCTTTGTGCTGGGCGCACTAGGCAATGGGGTCGCCCTGTGTGGTTTC 120

The present invertion retarges to nover to protein coupleto inceptions to fore present invertion retarges to nover to protein coupleto inceptions as 31-38, 40, 41, 53-60) and their coding sequences. The present sequence is the coding sequence for one such 6 protein-coupled receptor. Gedens are also known as seven transmembrane receptors and function in signal transduction. The nGPCRx coding sequences are useful for signal transduction. The nGPCRx coding sequences are useful for sometime a human to diagnose a disorder affecting the brain or a genetic predisposition, specifically schizophrenia. Detection of dentifying compounds useful for treating schizophrenia. Detection of copposition, specifically schizophrenia not agreed a disorders of insorders, infections such as HIV-1, metabolic and cardiovascular disorders, infections such as HIV-1, metabolic and cardiovascular diseases, proliferative disorders and hormonal disorders. Modulators of copposition schizophrenia, ADHD/ADD (attention deficit disorder), and neuronal disorders such as include inflammatory conditions (e.g. Crohn's disease), rheumatolid arthritis, autolmmune disorders, cancers, concers, conce

The present sequence encodes a member of the G-protein coupled receptor. (TTM receptor) family, designated the HM/4A receptor. The proteins, agonists, antagonists and polynucleotides can be used for treating disorders associated with increased or reduced expression or activity of HM/4A, e.g. bacterial, fungal, protozoan and viral infections, particularly infections caused by HIV-1 or HIV-2, pain, cancers, cliabetes, obesity, anorexia, bulimia, asthma, Parkinson's disease, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, stroke, ulcers, asthma, allergies, benign prostatic hypertrophy, migraine, vomiting, psychotic and neurological disorders, including anxiety, schizophrenia manic depression, depression, deliritum, dementia, and severe mental retardation, and dyskinesias such as Huntington's disease or cetardation, and dyskinesias such as Huntington's disease or cetardation, and control of the products can also be used for
                                                                HM74A receptor; G-protein coupled receptor; infection; pain; cancer; diabetes; obesity; neurological disorder; heart failure; hypertension; asthma; allergy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  97 ATAGACAAGAAGTGCTGTGTTCCGAGATGACTTCATTGTCAAGGTGTTGCCGCCG 156

The sequence encodes a human G-protein coupled receptor (GPCR), hRUP25. The endogenous and non-endogenous, constitutively activated versions of human G-protein coupled receptors (GPCR), are useful for direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists having applicability as therapeutic agents for treating diseases related to GPCR, e.g. lung cancer. Non-endogenous version of human GPCRs are also utilized in research settings and in vitro and in vivo system, incorporating GPCRs can be utilised to elucidate and understand the roles these receptors play in the human condition, both normal and diseased.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Endogenous and non-endogenous versions of human G-protein coupled receptors for direct identification of candidate compounds as agonists, inverse agonists or partial agonists for use as therapeutic agents -

The invention relates to constitutively active, non-endogenous versions of endogenous human orphan G protein-coupled receptors (GPCRs, AAY90643-AAY90677 and AAY90677 and AAY90677 and AAA30709-A30743 and AAA30779-A30779). The mutant proteins of the invention contain a mutation in a portion of the protein comprising intracellular loop 3 (IC3) and transmembrane domain 6 (TM6). A non-endogenous anno acid, X, is substituted for an endogenous residue in IC3 at a position 16 amino acids N-terminal of an endogenous residue in IC3 at a position 16 amino acids N-terminal of an endogenous proline in TM6 to form a sequence or Ala, and is preferably Lys. When the endogenous residue at this Argor Ala, and is preferably Lys. When the endogenous residue at this position is Lys, this residue is replaced by His, Argor preferably Ala. The 15 amino acid stretch between the substituted amino acid and the Promay be endogenous. An endogenous, or a mixture of endogenous and con-endogenous residues. The constitutively active GPCRs are useful for identifying antagonists, agonists and partial agonists for use as pharmaceutical agents. The mutant proteins are also useful for identifying antagonists. The mutant proteins are also useful for settings for elucidating the roles of the receptors in normal and discassed and discates associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used directly for screening of compounds without the need for endogenous in an exemplification of the invention. This was cloned and subjected unstant of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  456

The invention relates to constitutively acree throughous versions of endogenous human orphan G protein coupled receptors (GPCRs, AAY90643-A3079). The mutant proteins of the invention contain a mutation in a portion of the protein comprising intracellular loop 3 (IC3) and transmembrane domain 6 (TM6). A non-endogenous amino acid, X, is substituted for an endogenous residue in IC3 at a position 16 amino acids N-terminal of an endogenous residue in IC3 at a position in amino acid X-(AA)15-pro. The endogenous amino acid is selected from Lys, His, Arg or Ala, and is preferably Lys. When the endogenous residue at this position is Lys, this residue is replaced by His, Arg or preferably Ala. The 15 amino acid stretch between the substituted amino acid and the Promogonius residues. The constitutively active GPCRs are useful for identifying antagonists, agonists and partial agonists for use as pharmaceutical agents. The mutant proteins are also useful in research setting for succeptors in normal and diseased conditions. Antagonists for a particular GPCR are useful for treating diseases and disorders associated with that receptor. Because the novel mutant GPCRs are constitutively acidive, they can be used directly for screening of compounds without the need for endogenous ingaids. Sequences AAA30793 and AAA30779 represent DNAs
invention relates to constitutively active, non-endogenous versions

```
Consensus sequences are identified from nine rat gene receptors. The receptors are for somatostatin, substance K, substance P, neuromedin K, thyrotropin, HH/CG and others designated mas, mrg and rta. Four regions of nucleotide sequence are found to exhibit a degree of conservation significant enough to design degenerate oligo primers for PCR (see AAQ55045-49). Five oligos are designed with 4 - to 64-fold direct degeneracy plus 5%-23% inosines. The oligos are designed to anneal sequences in G protein-linked peptide receptor genes. They are used as six different primer pairs for PCR using rat genomic DNA

as template. All six reactions produce DNA fragments of the expected size. DNA fragments are cloned and two samples, designated PCR9 and PCR11(AAQ55054,Q55065), are found to contain sequences characteristic of g protein-linked receptors. Each fragment contains a single ORF. There is considerable similarity between rat somatostatin receptor and PCR11, suggesting that PCR11 is a novel somatostatin receptor subtype. Both fragments exhibit not only primary sequence similarity to other receptors but also the hydropathy pattern characteristic of G protein-linked receptors. The novel G protein-linked receptors are possibly of the peptide ligand subclass.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               395

The invention relates to nucleic acid sequences (ABAB1529-ABAB1552) that encode Groupled protein-receptor related polypeptides acquence differing (ABB44522-ABB4443). The isolated polypeptide having a sequence differing by no more than 15 % of amino acid residues from one of 22 amino acid sequences (or mature forms of the sequences), fully defined in the sequences (or mature forms of the sequences), fully defined in the completion of the sequences), fully defined in the sequences (or mature forms of the sequences), fully defined in the completion of the sequences (or present or present of the sequences) and instruction of the sequence of the sequences or present or present cardiomyopathy, atherosclerosis, disorders related to signal processing and metabolic pathway modulation (e.g. cobesity, anorexia), diabetes, osteoporosis, Crohn's disease, multiple cobesity, anorexia, dishaman, diabetes, osteoporosis, Crohn's disease, multiple cobesity, anorexia, dishaman, diabetes, osteoporosis, crohn's disease, multiple cobesity, anorexia, the sequence of or predisposition to a disease associated to determine the presence of or predisposition to a disease associated control samples. They are useful to identify agents binding polypeptide control samples. They are useful to identify agents binding polypeptide control samples. They are useful to identify agents binding polypeptide control samples or benefactors and control samples. They are useful to destrain a ceceptors or downstream effectors and control are to be the profession levels of cellular receptors or downstream effectors and control are to be the profession and a disease associated control samples. They are useful to identify agents binding polypeptide control samples are a protein and a disease associated control samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                New human G-protein coupled receptor X, GPCRX, polypeptide useful in treatment or prevention of GPCRX associated disorders e.g. cardiomyopathy or atherosclerosis, and to screen for antagonists and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               modulating cellular polypeptide expression or activity, useful as antagonists and agonists in disease treatment
                                                                                                                                                                                                                                                                          Spaderna SK;

Novel human G-protein coupled receptor proteins and nucleic acid addignostic compositions and for identifying modulators of the and diagnostic compositions and for identifying modulators of the and diagnostic compositions and for identifying modulators of the rotein and diagnostic compositions and for identifying modulators of the protein relates to the isolation of a novel human G-protein coupled receptor (GPCR) which is related to the chemokine receptor coupled receptor (GPCR) which is related to the invention are useful coupled receptor (GPCR) which is related to the invention are useful coupled receptor (GPCR) which is reading diseases or conditions mediated by human proteases. Such diseases include hyperproliferative discretars (e.g. hyperplasia) neurological disorders (e.g. Parkinson's disease), softworhistric diseases (e.g. Schizophrenia), inflammanchy disorders (e.g. diabetes) and respiratory disorders and respiratory distract to fittle expense in a related to members of the chemokine receptor subfamily, in drug screening assays and in competition to disease mediated by the peptide, in pharmacogenomic analysis. The polynucleotide sequences

The sequence represents a human G-protein coupled receptor (GPCR), hRUP19. The endogenous and non-endogenous, constitutively activated versions of human G-protein coupled receptors (GPCR), are useful for direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists having applicability as therapeutic agents for treating diseases related to GPCR, e.g. lung cancer. Non-endogenous version of human GPCRs are also utilized in research settings and in vitro and in vivo system, incorporating GPCRs can be utilised to elucidate and understand the roles these receptors play in the human condition, both normal and diseased.
                                                                                                               receptors for direct identification of candidate compounds as agonists, inverse agonists or partial agonists for use as therapeutic agents -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              signal transduction; schizophrenia; thyroid disorder; renal failure, rheumatoid arthritis; CNS disorder; infection; metabolic disease; cardiovascular disease; proliferative disorder; hormonal disorder; neurological disorder; neuronal disorder; harmonal disorder; attention deficit-hyperactivity disorder/attention deficit disorder; Parkinson's disease; migraine; senile dementia; inflammatory disease; rheumatoid arthritis; autoimmune disorder; respiratory ailment;

                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to novel G protein-coupled receptors

(nGPCRx; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27,

28, 31-38, 40, 41, 53-60) and their coding sequences. The present

sequence is one such G protein-coupled receptor: GPCRs are also known as

c seven transmembrane receptors and function in signal transduction. The

c nGPCRx coding sequences are useful for screening a human to diagnose a

disorder affecting the brain or a genetic predisposition, specifically

c chizophrenia. nGPCRx are useful for identifying compounds useful for

treating schizophrenia. Detection of nGPCRx in a sample is useful as a

diagnostic tool for diseases or disorders e.g. thyroid disorders, renal

failure, rheumatoid arthritis, CNS disorders, infections such as HIV-1,

metabolic and cardiovascular diseases, proliferative disorders and

c treating neurological disorders, including schizophrenia, ADHD/ADD

c treating neurological disorders, including schizophrenia, ADHD/ADD

c (attention deficit hyperactivity disorder/attention deficit disorder),

and neuronal disorders such as Alzheimer's disease, Parkinson's disease,

migraine and senile dementia. Additional disorders include inflammatory

c conditions (e.g. Crohn's disease), rheumatoid arthritis, autoimmune

diseases e.g. inflammatory bowel disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention relates to nucleic acid sequences (ABA81529-ABA81552) that encode G-coupled protein-receptor related polypeptides as equence differing to more than 15 % of amino acid residues from one of 22 amino acid sequences (or mature forms of the sequences), fully defined in the sequences (or mature forms of the sequences), fully defined in the sequences (or mature forms of the sequences), fully defined in the completication and corresponding to human G-protein coupled receptor X (GFCRX) polypeptides. The polypeptides have potential cardiant, antiarteriosclerotic, anabolic, cytostatic and antiviral activity. The colypeptides can be administered therapeutically, especially using gene therapy and expressing the encoding DNA in humans. For example, they can be used to treat/prevent cardiomyopathy, atherosclerosis, disorders related to signal processing and metabolic pathway modulation (e.g. obesity, anorexia), diabetes, osteoporosis, crohn's disease, multiple colesity, anorexia, disorder, Huntington's disease, immune disorders, haematopoietic disorders, developmental diseases, neurological disorders, haematopoietic disorders, developmental diseases, neurological disorders, condetermine the presence of or predisposition to a disease associated control samples, they are useful to identify agents binding polypeptide control samples. They are useful to identify agents binding polypeptide control samples are perfectors or advisor or predisposition.
revention of GPCRX associated disorders e.g. or atherosclerosis, and to screen for antagonists and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (e.g. cellular receptors or downstream effectors) and/or agents modulating cellular polypeptide expression or activity, useful as antagonists and agonists in disease treatment.
  treatment or prevention of GPCRX

Hiebsch RR, Lind P, Slightom J; Bannigan CM, Parodi LA, PS, Banni Schellin KA, Kaytes ĽS, Wood Vogeli

WPI; 2001-389826/41. N-PSDB; AAH50974 New G protein-coupled receptor (nGPCR-x) and its encoding polynucleotide useful for diagnosing and treating e.g. schizophrenia

Claim 37; Pages 77-78; 261pp; English.

treating neurological disorders, including schizophrenia, ADHD/ADD (attention deficit-hyperactivity disorder/attention deficit disorder), and neuronal disorders such as Alzheimer's disease, Parkinson's disease, migraine and senile dementia. Additional disorders include inflammatory conditions (e.g. Crohn's disease), rheumatoid arthritis, autoimmune disorders, cancers, respiratory ailments such as asthma, and inflammatory diseases e.g. inflammatory bowel disease. The present invention relates to novel G protein-coupled receptors (nGPCRx; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27, 28, 31-38, 40, 41, 53-60) and their codding sequences. The present sequence is one such G protein-coupled receptor. GPCRs are also known as seven transmembrane receptors and function in signal transduction. The nGPCRx coding sequences are useful for screening a human to diagnose a disorder affecting the brain or a genetic predisposition, specifically schizophrenia. nGPCRx are useful for identifying compounds useful for treating schizophrenia. Detection of nGPCRx in a sample is useful as a diagnositic tool for diseases or disorders e.g. thyroid disorders, renal failure, rheumatoid arthritis, CNS disorders, infections such as HIV-1, metabolic and cardiovascular diseases, proliferative disorders and hormonal disorders. Modulators of nGPCRx activity have the utility for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (7TM receptor) family, designated the HM74A receptor. The proteins, agonists, antagonists and polynucleotides can be used for treating disorders associated with increased or reduced expression or activity of HM74A, e.g. becterial, fungal, protozoan and viral infections, particularly infections caused by HTV-1 or HTV-2, pain, cancers, diabetes, obesity, anorexia, bulimia, asthma, Parkinson's disease, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, stroke, ulcers, asthma, allergies, benign prostatic hypertrophy, migraine, vomiting, psychotic and neurological disorders, including anxiety, schizophrenia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      HM74A receptor; G-protein coupled receptor; infection; pain; cancer;
diabetes; obesity; neurological disorder; heart failure; hypertension;

                                                                                                                                                                                                                                                                                                   The sequence represents a human G-protein coupled receptor (GPCR), hRUP25. The endogenous and non-endogenous, constitutively activated versions of human G-protein coupled receptors (GPCR), are useful for direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists having applicability as therapeutic agents for treating diseases related to GPCR, e.g. lung cancer. Non-endogenous version of human GPCRs are also utilized in research settlings and in vitro and in vivo system, incorporating GPCRs can be utilised to elucidate and understand the roles these receptors play in the human condition, both normal and diseased.
                                                                                                                                                                                                       Endogenous and non-endogenous versions of human G-protein coupled receptors for direct identification of candidate compounds as agonists, inverse agonists or partial agonists for use as therapeutic agents -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 65 MICLPFRIDYYLRRHWAFGDIPCRVGLFILAMNRAGSIVFLTVVAADRYFKVVHPHHAV 124

cc and AAN90573-30709). The mutant protein-coupled receptors (GPCRs, AAY90643-AAY90677 and AAN90683-Y90687), and to DNA encoding them (AAA30709-A30743-AAY90677). The mutant protein comprising them (AAA30709-A30743-A30709). The mutant protein comprising intracellular loop 3 mutation in a portion of the protein comprising intracellular loop 3 cc 153 and transmembrane domain 6 (TM6). A non-endogenous amino acid, X, is substituted for an endogenous residue in IC3 at a position 16 amino cc acids N-terminal of an endogenous proline in TM6 to form a sequence X-(AA)15-Pro. The endogenous amino acid is selected from Lys, H1s, Arg or AA)15-Pro. The endogenous amino acid is selected by H1s, Arg or preferably Va. When the endogenous acid and the Pro may be endogenous, non-endogenous, or a mixture of endogenous and con-endogenous residues. The constitutively active GPCRs are useful for identifying antagonists. The mutant proteins are also useful in research conditions. Antagonists for a particular GPCRs are useful for treating diseases and disorders associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used diseased conditions. Antagonists for a particular GPCR are useful for treating diseases and disorders associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used directly for screening of compounds without the need for endogenous conditions. Antagonists and AAY90677 and AAY90681-Y90687 the mutant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to constitutively active, non-endogenous versions

                                                ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY30673 and AAY30683-Y90697), and to DNA encoding them (AAA30709-A30743 and AAA30775-A30779). The mutant proteins of the invention contain a mutation in a portion of the protein comprising intracellular loop 3 (IC3) and transmembrane domain 6 (TM6). A non-endogenous amino acid, X. is substituted for an endogenous residue in IC3 at a position 16 amino acids N-terminal of an endogenous proline in TM6 to form a sequence X-(AA)15-Pro. The endogenous amino acid is selected from Lys, His, Arg or AA)15-Pro. The endogenous amino acid is selected from Lys, His, Arg or AA)15-Pro. The endogenous amino acid is selected from Lys, His, Arg position is Lys, this residue is replaced by His, Arg or preferably Ala. The 15 amino acid stretch between the substituted amino acid and the Pro may be endogenous, non-endogenous, or a mixture of endogenous and non-endogenous residues. The constitutively active GPCRs are useful for identifying antagonists, agonists and partial agonists for use as settings for elucidating the roles for a particular GPCR are useful for treating diseases and disorders associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used directly for screening of compounds without the need for endogenous constitutions. Antagonist such active, they can be used directly for screening of compounds without the need for endogenous constitutively active, they can be used directly for screening of compounds without the need for endogenous constitutions. The present expresents a human wild-type GPCR referred the constitutions and the constitutively active, they can be used directly for screening of compounds without the need for endogenous constitutions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to constitutively active, non-endogenous versions
  Non-endogenous constitutively activated human G protein-coupled receptors, useful for identifying agonists for use as pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 880.5; DB 21; Length 387;

The invention relates to human G protein-coupled receptor (GPCR) and their corresponding DNA molecules. GPCR is also referred as seven transmembrane receptor. G protein-coupled receptor protein is useful for treating neurological disorder, particularly schizophrenia. GPCR protein is also useful for identifying compounds useful for treating other neurological and psychiatric diseases, e.g. depression, anxiety, bipolar currention deficit disorder, attention deficit hyperactivity disorder, attention deficit disorder, epilepsy, neuritis, neurasthenia, neuropathy, neurosis, Alzheimer's disease, parkinson's disease, migraine and semile dementia. The invention also provides genetic screening procedures that camental analysing a person's genome with respect to GPCR. The vectors are useful for the recombinant production of the GPCR. The present sequence is human CON103 G protein-coupled receptor (GPCR) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  7;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Seven transmembrane receptor polypeptides and polynucleotides, useful for treating neurological or psychiatric disorders, e.g. schizophrenia, as well as for identifying compounds useful for treating schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         LSRASVGAAARVAGGLWVGI-----LLLNGHLLLSTFSGPSCLSYRVGTKPSASLRWHQ 215

This is the amino acid sequence of a novel human G protein coupled receptor, designated HEOAD54, as deduced from a CDNA clone (see AAX06947) isolated from an eosinophil library. A method is claimed for diagnosing susceptibility to disease resulting from mutation of the HEOAD54 gene or imbalance in HEOAD54 polypeptide expression levels. HEOAD54 activate/Inhibit expression, build administration of HEOAD54 activate/Inhibit cosed to prevent expression, while administration of HEOAD54 is used to prevent expression, while administration of HEOAD54 is used to prevent expression, while administration of HEOAD54 is used to treat conditions associated with a lack of HEOAD54 protein. Gene expression. HEOAD54 polypeptides can be administered directly or as a vaccine to inoculate against disease. Diseases diagnosed, corrects, anorexia, builmia, asthma, Parkinson's disease, acute heart failure, hypotemsion, hypertension, urinary retention, osteoporosis, andian pectoris, myocardial infarction, utcer, allergy, benign prostatic hypertrophy, and psychotic and neurological disorders including anxiety, schizophrenia, manic depression, delirium, dementia, severe mental retardation and dyskinesias, such as Huntington's disease or Gilles de la
                                                                                                                                                                                                                                                                                        HEOAD54; 7-transmembrane receptor; G protein coupled receptor; signal transduction; human; infection; HIV-1; HIV-2; pain; cancer; anorexia; bulimia; asthma; Parkinson's disease; hypotension; hypertension; acute heart failure; urinary retention; osteoporosis; angina pectoris; myocardial infarction; ulcer; allergy; benign prostatic hypertrophy; anxiety; schlzophrania; delirium; manic demersion; demeria, severe mental reterdation; dyskinesia; Huntington's disease; Gilles de la Tourette's syndrome; diagnosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New G-protein coupled receptor (HEOAD54) polypeptide and polynucleotide - useful as diagnostic reagents, and for prevention and treatment of HIV infections and cancer

                                                                                   hRUP11. The endogenous and non-endogenous, constitutively activated versions of human G-protein coupled receptors (GGCR), are useful for direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists having applicability as therapeutic agents for treating diseases related to GPCR, e.g. lung cancer. Non-endogenous version of human GPCRs are also utilized in research settings and in vitro and in vivo system, incorporating GPCRs can be utilised to elucidate and understand the roles these receptors play in the human condition, both normal and diseased.
                     receptors for direct identification of candidate compounds as agonists, inverse agonists or partial agonists for use as therapeutic agents -

The present sequence is a novel human cell surface receptor protein (HCSRP) designated HCSRP-6. The nucleotide sequence was identified in correct Clone 2851578 from the CDNA library BRSTTUT13, which was made from the cDNA library BRSTTUT13, which was made from breast tumour tissue. A number of Incyte Clones correct sequence is homologous to rhodopsin-like GPCR/HM7 q21967 isoform g5070877. HCSRP and its antagonist are useful for preventing or treating disorders associated with decreased or increased expression or activity of HCSRP. Such disorders include cancers such as leukaemia and atherosclerosis, bacterial and parasitic infections and neuronal catherosclerosis, bacterial and parasitic infections and neuronal disorders such as akathesia, Alzheimer's disease, multiple sclerosis and epilepsy. Polynucleotides encoding HSCRPS may be used as hybridisation probes to diagnose these conditions. Anti-HCSRP antibodies may be used as antagonists, as a targeting or delivery mechanism for bringing harmaceutical agents into contact with cells or tissues expressing HCSRP and for Immunogenic fragments are useful for drug screening using libraries of compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New human cell surface receptor protein and polynucleotide useful for diagnosis, prevention and treatment of cancer, immune disorders, infection and neuronal disorders

The greater inventors to nove to procedure the procedure of the couples at black 20, 21, 22, 24, 27, 28, 31-38, 40, 41, 53-60) and their coding sequences. The present sequence is the coding sequence for one such 6 protein-coupled receptor. Gequence 1s the coding sequence for one such 6 protein-coupled receptor. Getter also known as seven transmembrane receptors and function in signal transduction. The nGPCRx coding sequences are useful for screening a human to diagnose a disorder affecting the brain or a genetic screening a human to diagnose a disorder affecting the brain or a genetic conferx in a sample is useful for treating schizophrenia. Detection of nGPCRx in a sample is useful for treating schizophrenia. Detection of disorders e.g. thyroid disorders, renal failure, rheumatoid arthritis, CNS disorders and hormonal disorders. Modulators of disorders in fections such as HIV-1, metabolic and cardiovascular diseases, proliferative disorders and hormonal disorders. Modulators of nGPCRx activity have the utility for treating neurological disorders, including schizophrenia, ADHD/ADD (attention deficit-hypersactivity disorder/attention deficit disorder), and neuronal disorders such as Alzheimer's disease, Parkinson's disease, migraine and senile dementia. Alacaase) rhammatoid ascentia antitonia disorders include inflammatory conditions (e.g. Crohn's antitonia disorders).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               a genetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is a member of the G-protein coupled receptor (7TM receptor) family, designated the HW74A receptor. The proteins, agonists, antagonists and polyuncleotides can be used for treating disorders associated with increased or reduced expression or activity of HW74A, e.g. bacterial, fungal, protozoan and viral infections, particularly infections caused by HIV-1 or HIV-2, pain, cancers, disbetts, obesity, anorexia, bulimia, asthma, Parkinson's disease, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, stroke, ulcers, asthma, allergies, benign prostatic hypertrophy, migraine, vomiting, psychotic and neurological disorders, including anxiety, schizophrenia,

```
The present sequence encodes a member of the G-protein coupled receptor (7TM receptor) family, designated the HM74A receptor. The proteins, agonists, antagonists and polynuclectides can be used for treating disorders associated with increased or reduced expression or activity of HM74A, e.g. bacterial, fungal, protozoan and viral infections, particularly infections caused by HIV-1 or HIV-2, pain, cancers, clabetes, obbesity, anorexia, bulimia, asthma, Parkinson's disease, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, mycoardial infarction, stroke, ulcers, asthma, allergies, benign prostatic hypertrophy, migraine, vomiting, psychotic and neurological disorders, including anxiety, schizophrenia, maint depression, depression, delinium, dementia, and severe mental retardation, and dyskinesias such as Huntington's disease or cities de la Tourett's syndrome. The products can also be used for
                                                                                                                                                                                                                                            HM74A receptor; G-protein coupled receptor; infection; pain; cancer; diabetes; obesity; neurological disorder; heart failure; hypertension; asthma; allergy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated G-protein coupled receptor, HM74A - used to develop products for treating e.g. infections, pain, cancers, diabetes, obesity, neurological disorders, heart failure, hypertension, asthma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mooney JL;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 1361;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             C; 3...

The present invention relates to novel G protein-coupled receptors (GPCRx; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27, 28, 31-38, 40, 41, 53-60) and their coding sequences (see CRH50969-AAH51015 and AAH51010S and AAG80929-AAG80975 and AAG80977). The present sequence is an oligonucleotide, which was used in the present present sequence as an oligonucleotide, which was used in the present invention of GPCRs are also known as seven transmembrane receptors and invention in signal transduction. The nGPCRx coding sequences are useful consciount of a present predisposition, specifically schizophrenia. nGPCRx are useful conferent in a sample is useful for treating schizophrenia. Detection of GPCR in tentifying compounds useful for treating schizophrenia. Detection of GPCRX disorders e.g. thyroid disorders, remain failure, rheumatoid arthritis, clisorders, infections such as HIV-1, metabolic and cardiovascular diseases, proliferative disorders and hormonal disorders. Modulators of
                                                                                                              G protein-coupled receptor; nGPCR; seven transmembrane receptor; signal transduction; schizophrenia; thyroid disorder; renal failure; rheumatoid arthritis; CNS disorder; infection; metabolic disease; cardiovascular disease; proliferative disorder; hormonal disorder; neurological disorder; neuronal disorder; Alzheimer's disease; cancer; attention deficit thyperactivity disorder/attention deficit disorder; Parkinson's disease; migraine; senile dementia; inflammatory disease; rheumatoid arthritis; autoimmune disorder; respiratory ailment;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Parodi LA, Hiebsch RR, Lind P, Slightom J;
